

第四章作业讲解

纲要

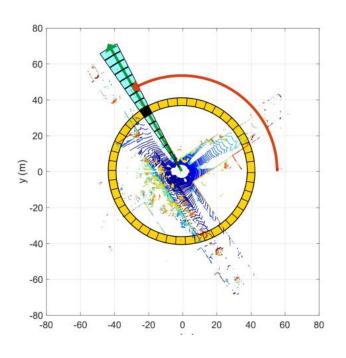

▶第一部分: Scan Context

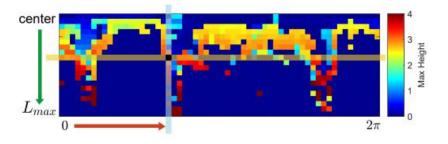

▶第二部分:核心函数讲解

▶第三部分:作业实现

Scan context

纲要

▶第一部分: Scan Context

▶第二部分:核心函数讲解

▶第三部分:作业实现

核心函数讲解

```
bool Matching::SetScanContextPose(const CloudData& init_scan) {
// get init pose proposal using scan context match:
Eigen::Matrix4f init_pose = Eigen::Matrix4f::Identity();
     !scan_context_manager_ptr_->DetectLoopClosure(init_scan, init_pose)
SetInitPose(init_pose);
has_inited_ = true;
```

核心函数讲解

```
bool Matching::SetGNSSPose(const Eigen::Matrix4f& gnss_pose) {
 static int gnss_cnt = 0;
current_gnss_pose_ = gnss_pose;
if ( gnss_cnt == 0 ) {
     SetInitPose(gnss_pose);
} else if (gnss_cnt > 3) {
    has_inited_ = true;
gnss_cnt++;
```

纲要

▶第一部分: Scan Context

▶第二部分:核心函数讲解

▶第三部分:作业实现

作业实现

```
bool MatchingFlow::UpdateMatching() {
if (!matching_ptr_->HasInited()) {
    // TODO: implement global initialization here
    if(matching_ptr_->SetScanContextPose(current_cloud_data_)) {
        LOG(INFO) << "Scan Context Localization Init Succeeded !" << std::endl;
    else{
        matching_ptr_->SetGNSSPose(current_gnss_data_.pose);
        LOG(INFO) << "GNSS Init Succeeded !" << std::endl;
return matching_ptr_->Update(current_cloud_data_, laser_odometry_);
```

感谢各位聆听 Thanks for Listening
